No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A; Residues: 1-117 <1862>
A; Residues: 1-117 <1862>
A; Residues: 1-117 <1862>
A; Mote: the B1-8 mu chain mRNA was cloned from a hybridoma making antibodies to the hapt A; Note: the 186-2 germline gene was cloned from a library of C57BL/6 DNA
B; Dildrop, R.; Bruggemann, M.; Radbruch, A.; Rajewsky, K.; Beyreuther, K.
BEMBO J. 1, 635-646, 1982
A; Title: Immunoglobulin V region variants in hybridoma cells. II. Recombination between A; Reference number: A90971; MUID: 84236026
A; Accession: A22769
A; Molecule type: Frotein
A; Residues: 20-135 < DIL>
A; Note: the V region of the B1-8 delta chain, derived as a spontaneous class switch variant mu chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              - mouse (fragment)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ÷

A.Rote: the germline gene, cloned from the germline gene
A.Rote: the germline gene, cloned from a library of strain C57BL/6 DNA, is one of a set (NPb antibodies)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A; Molecule type: DNA
A; Residues: 1-117 <BOT>
A; Note: the sequence was determined from the germline gene
A; Note: the sequence was determined from a library of strain C57BL/6 DNA, is in (NPb antibodies)

If heavy chain precursor V region (186-1) - mouse C; Species: Mus musculus (house mouse) C; Species: Mus musculus (house mouse) C; Date: 31-Mar-1989 #text_change 23-Aug-1996 C; Date: 31-Mar-1989 #sequence_revision 31-Mar-1989 #text_change 23-Aug-1996 C; Accession: D90809; Accession: B00809; MulD: Reth, M.; Imanishi-Kari, T.; Rajewsky, K.; Baltimore Cell 24, 625-637, 1981 A: Title: Heavy chain variable region contribution to the NP(b) family of antibodies: A; Reference number: A90809; MulD: 81234548
                                                                                                                                                                                                                                                                                                        A; Molecule type: DNA
A; Residues: 1-117 <BOT>
A; Note: the sequence was determined from the germline gene
A; Note: the 186-1 germline gene, cloned from a library of strain C57BL/6 DNA, belongs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. the number of Pred. No.

                                                                                                                                                                                                                                                                                                         ö
                                                                                                                          The present sequence represents the heavy chain varaible region of murine antibody Act-1. Act-1 is active against human alpha4-beta7 integrin. Muscosal adressin cell adhesion molecule-1 (MadCAM-1) is a ligand of th.s particular integrin. The Act-1 antibody inteferes with alpha4-beta7 integrin binding to MadCAM-1, which is present of high endothelial venules in mucosal lymph nodes. Humanised Act-1 can be used to inhibit the interaction of cells bearing alpha4-beta7 with cells bearing a light of crapha4-beta7. It can be used for inhibiting diseases such as inflammatory bowel diseases. The immunoglobulin can also be used for detection, isolation and diagnosis.

                                                                                                                                                                                                                              The present sequence represents the amino acid sequence comprising the variable region of murine Act-1 antibody determined from clone H2B#34. Act-1 is active against human alpha4-beta7 integrin. Muscosal adressin cell adhesion molecule-1 (MadCAM-1) is a ligand of this particular integrin. The Act-1 antibody inteferes with alpha4-beta7 integrin binding to MadCAM-1, which is present of high endothelial venules in mucosal lymph nodes. The present sequence was used to construct chimeric. In the humanised Act-1 antibodies, which contain murine antigen binding regions. The humanised for inhibit can be used to inhibit the interaction of cells bearing alpha4-beta7 with cells bearing a ligand for alpha4-beta7. It can be used for inhibiting leukocyte infiltration of tissues, e.g. for treating inflammatory diseases such as inflammatory bowel disease. The immunoglobulin can also be used for detection, isolation and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        GQGLEWIGEIDPSESNTNYNQKFKGKATLTVDISSSTAYMQLSSLTSEDSAVYYCARGGY 120

```

The present sequence represents the concensus minion care sequence.

Comprising the variable region of murine Act-1 antibody determined from several independent mouse heavy chain variable region clones. Act-1 is active against human alpha4-beta7 integrin. Muscosal adressin cell achesion molecule-1 (MadCAM-1) is a ligand of this particular integrin.

The Act-1 antibody inteferes with alpha4-beta7 integrin binding to MadCAM-1, which is present of high endothelial venules in mucosal lymph nodes. Variable regions were amplified from DNA encoding Act-1 using degenerate PCR primers V20079-82. The degeneracy of the PCR primers produced several different sequences, of which the present sequence is a consensus sequence. The present sequence was used to construct chimerlo, humanised Act-1 antibodies, which contain murine antigen binding regions. The humanised immunoglobulin can be used to inhibit the interaction of cells bearing alpha4-beta7 with cells bearing a ligand for alpha4-beta7. It can be used for inhibiting leukocyte infiltration of tissues, e.g. for treating infilammatory diseases such asserting a filammatory diseases such asserting a filammatory be used for antiform and also be used for antiform and also be used for antiform and also be used for antiform and also be used for antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform antiform an primers The present sequence represents the consensus amino acid sequence

This is the amino acid of the heavy chain of murine anti-human Fass monoclonal antibody HFE7A. CDNA (see V70129) encoding the heavy chain was obtained from HFE7A-secreting Mybridoma (FERM BP-5828).

CRNA by RT-PCR (see V70125-26). The invention provides humanised HFE7A antibodies are capable of inducing apoptosis in abnormal cells.

CRNA pressing Fas, and of inhibiting Pas-induced apoptosis in normal cells. They are used to evaluate, in animal models, treatments of diseases that involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune disease (e.g. systemic lupus cuch diseases, Hashimot's disease, graft versus host disease, Slogren syndrome, pernicious anaemia, Addisease, rheumatoid calcroderma, Goodpasture syndrome, Crohn's disease, rheumatoid gravis, multiple solerosis, Basedow's disease, thrombopenia purpura and insulin dependent diabetes), allergies, atopy, arterioscierosis, myocarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, hepatitis, AIDS and transplant rejection (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               murine; complementarity determining region; CDR; human Fas; Fas ligand; apoptosis modulator; programmed cell death; autoimmune disease; allergy; attopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; heavy chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61. The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs. Complementarity determining regions) to antibody HFETA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, the treatment or prevention of conditions such as autoimmune diseases, allowerulonephritis, aplastic anaemia (panmyalophthisis), hepatitis, AIDS and organ graft rejection. The present sequence represents the heavy chain of the murine anti-human Fas monoclonal antibody HFETA, which is produced by hybridoma HFETA (FERM-BP-5828).

This sequence represents a novel single chain antigen hybrid receptor (HR) and contains an extracellular domain specific for the hapten 4-hydroxy-5-iodo-3-nitrophenyl acetate (NIP) coupled to the CDB-alpha region and the transmembrane and signal-conducting intracellular parts of the CD3-zeta molecule. Such hybrid receptors comprise a receptor part notalised on the outside of the cell and specific to aparticular signal molecule and a receptor part originating from another receptor, localised on the inside of the cell and capable of setting off a signal inside the cell. The cell should also contain at least one other gene construct with a control region which can interact with the signal sent out by the hybrid receptor and thereby control expression of a transgene bound to this control region. Such cells are useful in gene therapy or for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /label= VL_B_1-8

Coding sequences for the Ig chains are also claimed. The invention provides consensus sequences of light and heavy chain J regions useful in the design of oligonuclectides (UIGs) for use as primers or probes for cloning immunoglobulinlight or heavy chain mixes or genes. Depending on the nature of design of a particular UIG, it may be capable of hybridizing to all Ig mRNAs or genes containing a single specific J sequence. UIG denotes universal immunoglobulin gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence encoded by anti-hepatitis B heavy chain variable region in pING2006E.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  to cancer
Donor splice sites were recreated in the 3' flanking regions tallow correct splicing of the variable and constant regions. 5' sequence was altered to introduce an initiation codon. The cloned antibody may be used int the prodn of reshaped or humanitsed antibodies which are less immunogenic than native antibodies and may be used to combat e.g. glioma, melanoma or carcinoma.

antigen and is produced and secreted by an E. coli host cell when the nucleic acid molecule is expressed in the host cell.

The polynuclocided molecule is used for the production of recombinant antibodies; which can be used for passive immunisation without negative immune reactions (e.g. serum sickness and anaphylactic shock), in labelled forms as immunoassay or imaging reagents, in complement mediated lysis and for therapeutic purposes when coupled to a toxin or other therapeutic agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             4;

                                                                                                                      A chimaeric polypeptide (W16340) comprises a mouse anti-HBsAg heavy chain variable region (derived from hybridoma ATCC CRL8017) and a human J region sequence. It is encoded by DNA sequences in plasmids pINC2006E (T70867) or pINC2012E (T70858). A complete polypeptide, comprising the mouse anti-HBsAg heavy chain variable region and human constant region, has been expressed in bacterial and transfected mouse cell hosts. Gene amplification has allowed prodn. of chimaeric heavy chain.
                                                               Secretable immunoglobulin heavy and light chain fragments - capable of assembling into chimeric antibodies, useful for e.g. passive immunisation, diagnosis, etc

This sequence represents a fragment of the human-mouse chimeric anti-hepatitis heavy chain encoded by the gene contained within processors. PinC2006E. Thic2006E was used in the method of the invention to express the chimeric heavy chain. The method of the invention to express the chimeric heavy chain. The method of the invention is for the production of a protein in a Gram-negative bacterium. The method improves on current techniques, by using a vector including DNA encoding the pectate lysse signal sequence (see T51034), attached to the sequence encoding the protein for production. The method is especially used to make immunoglobulins (Ig), particularly those with a human constant region, suitable for passive immunosation (without risk of serum sickness or anaphylaxis) or for in vivo/in vitro diagnosis and imaging. The ignay also be used therapeutically, optionally coupled to toxins, etc.

Alternatively the protein to be produced is the sweetener thaumatin. The presence of this signal sequence means that the protein is exported from the cytoplasm and can be recovered from the culture medium or periplasm, and can be recovered from the culture medium or periplasm, and can be recovered from the culture medium or periplasm, and can be expected from the culture medium or periplasm, and an experience of most human-human ig are of M class, easily contained and aggregated, and these can now be changed to G, A or E
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61 GOGLEWIGEIDPSESNTNYNQKFKGKATLTVDISSSTAYMQLSSLTSEDSAVYYCARGGY 120

The present sequence was used in the development of a novel method:

for the production of an immunoglobulin (Ig) fragment capable of

binding an antigen. The method comprises culturing an E. Coli host

that has been transformed with a nucleic acid molecule encoding the

culture that has been transformed with a nucleic acid molecule encoding the

culture that has been transformed with a nucleic acid molecule encoding the

culture that has been transformed with a nucleic acid molecule encoding the

culture to a DNA sequence encoding at least the variable region of

linked to a DNA sequence encoding at least the variable region of

culture to a single protactle; and (b) pectate lyase secretion signal sequence

operably linked to a DNA sequence encoding at least the variable

credion of an Ig light chain, where (a) and (b) are operably linked

credion of an Ig light chain, where (a) and (b) are operably linked

credion of an Ig light chain, where (a) and (b) are operably linked

credion of an Ig light chain, where (a) and (b) are operably linked

credion of an Ig light chain, where (a) and (b) are operably linked

credion of an Ig light chain, where (a) and (b) are operably linked

credion of an Ig light chain, where (a) and (b) are operably linked

credion of an Ig light chain, where (a) and (b) are operably linked

credion of an Ig light chain, where (a) and (b) are operably linked

credion of an Ig light chain; promoter to forms a produced by

chains an antibodies of production of the problem of class switching antibody molecules.

the problem of class switching antibody molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA encoding secretable immunoglobulin fragments - comprising at least the variable regions of light or heavy chains
